

OptSuite (Optical Measurement Suite)

Micro-optics characterization using phase-shifting interferometry

- We have developed a versatile Mach-Zehnder / Twyman-Green hybrid interferometer for micro-lens testing.

- Tunable, membrane-based, liquid-filled micro-lenses
- Tunable, membrane-based, pneumatic micro-mirrors
- Tunable micro-lens actuated by electro-wetting

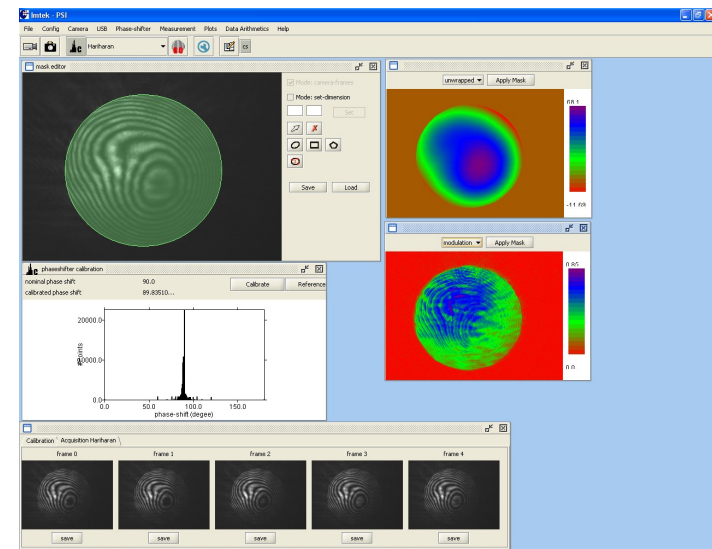

Optical coherence tomography (OCT)

- We are developing OCT-probes for in-vivo imaging of biological tissue.

- ImtekPSI
 - started during diploma thesis
 - specialized for PSI and hardly extendable for non Java-programmers
 - for phase shifting interferometry only
 - Java (Swing) technology

- Improvements needed
 - more extension possibilities
 - simple and faster extensibility

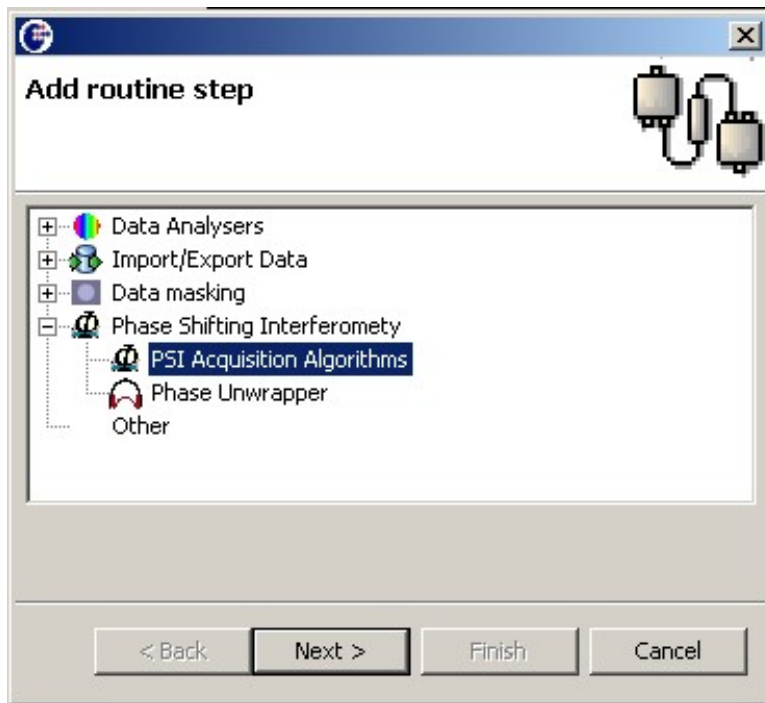

- Generic software concept
 - from a software for PSI to an general measurement software
 - simple object model that still can handle most needs for measurements in an optical lab
- Simple extension and adaption
 - adaption by graphically combining available parts to perform new tasks
 - extensions using Eclipse functionalities
 - „Macro“ extensions using simpler or more common languages like JavaScript or Matlab
- Benifits of an open platform
 - extensions shared and reusable
 - prevents multiple writing of libraries and tools

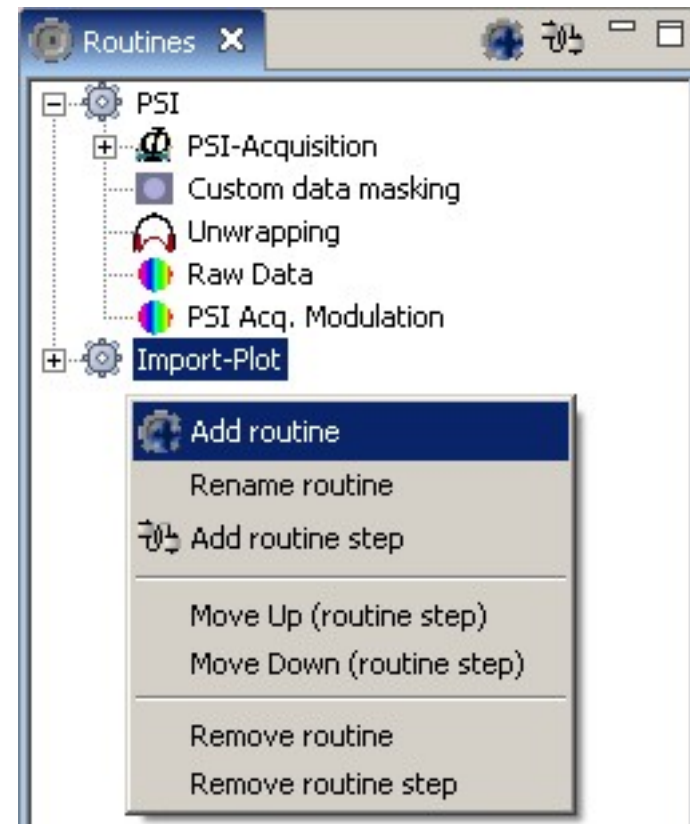

- Measurement Tools
 - A set of extensions reflecting real (hardware) tools
 - Independently configurable for each task (configurations stored)
 - Useable by all actions of OptSuite
 - Examples:
 - IntensityDetector
 - 2D: FireWire: Camera, more to come
 - 1D: soon to come
 - PhaseShifter
 - StageControl
 - GPIB Interface
 - LightSourceControl (Laser, Beamer)

- MeasurementRoutineSteps
 - Finite, small, reusable actions
 - Examples: Data acquisition (PSI, OCT ...), Data masking, Unwrapping, Data analysis (Display, Zernike-Fit, ...)
- MeasurementRoutines:
 - Sequence of arbitrary steps performed one after the other
 - Stored to disk for reuseability
 - Each step has an own configuration within the routine
- MeasurementRoutineSequences
 - Sequence of arbitrary routines
 - After each routine a „routine-transition“ step is performed
 - Possible application: Automated batch measurements with stage translation between measurements

- Routines – View
 - View to manage routines, steps sequences and their configuration
 - Coupled to routine-detail for configuration management

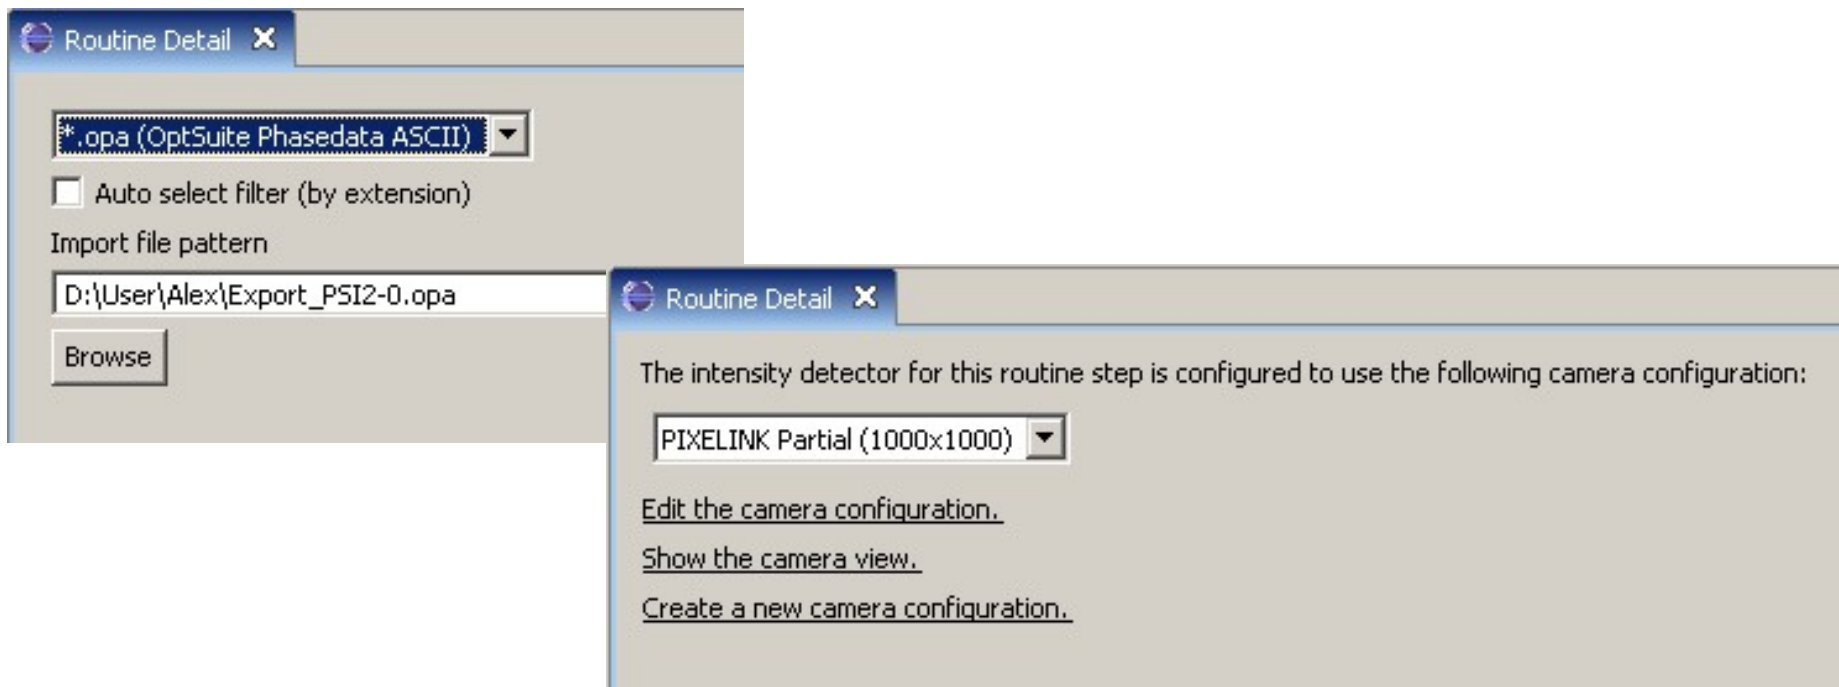

The „add routine step“ wizard

The routine view

- Several wizards for common tasks like adding routines or steps

- RoutinesDetail – View
 - Each RoutineStep might contribute to the Detail View to allow the user to configure the step
 - MeasurementTools may also contribute to the detail view

Examples for the contribution to the „Routine Detail“ View

- Routines are started with the „Run Routine“ Dropdown action

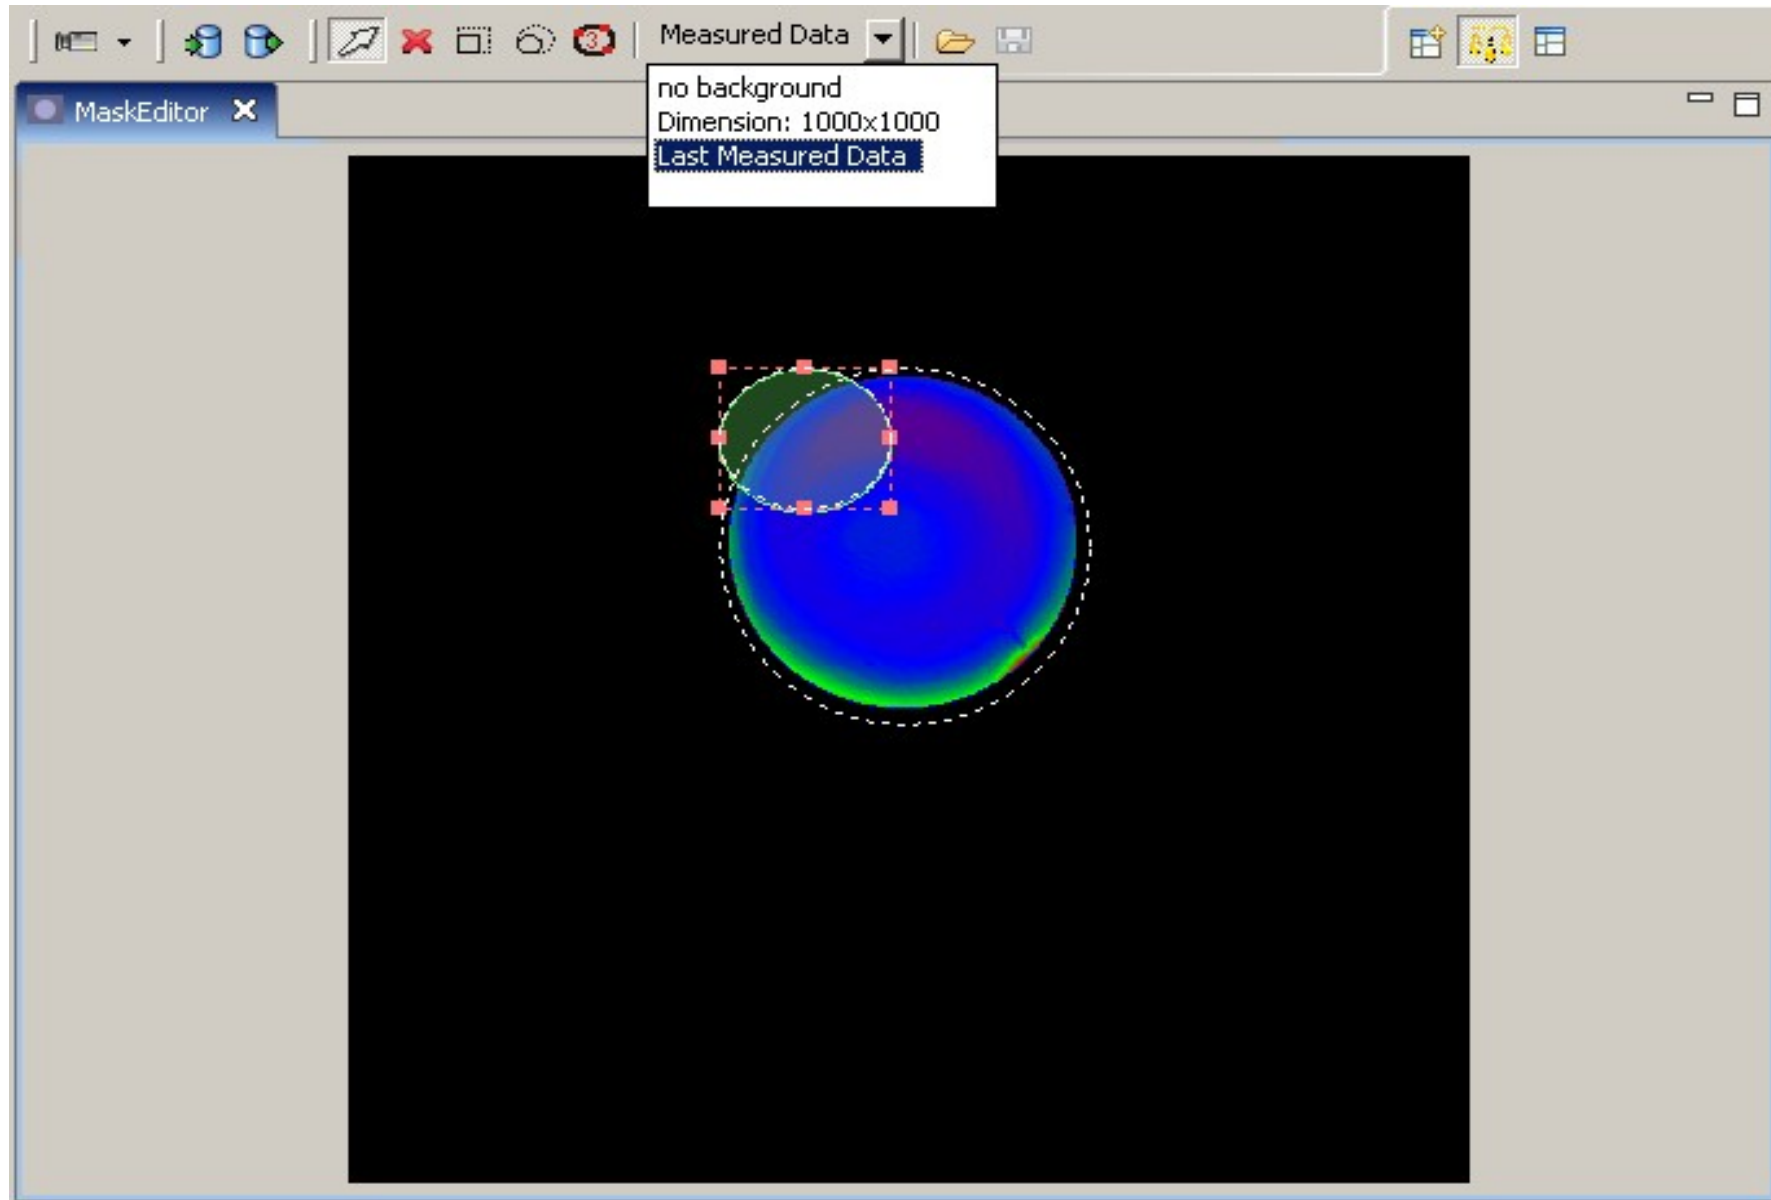

- Routines are executed as Eclipse Job, so they can be sent to background allowing the user to continue work while it is running.

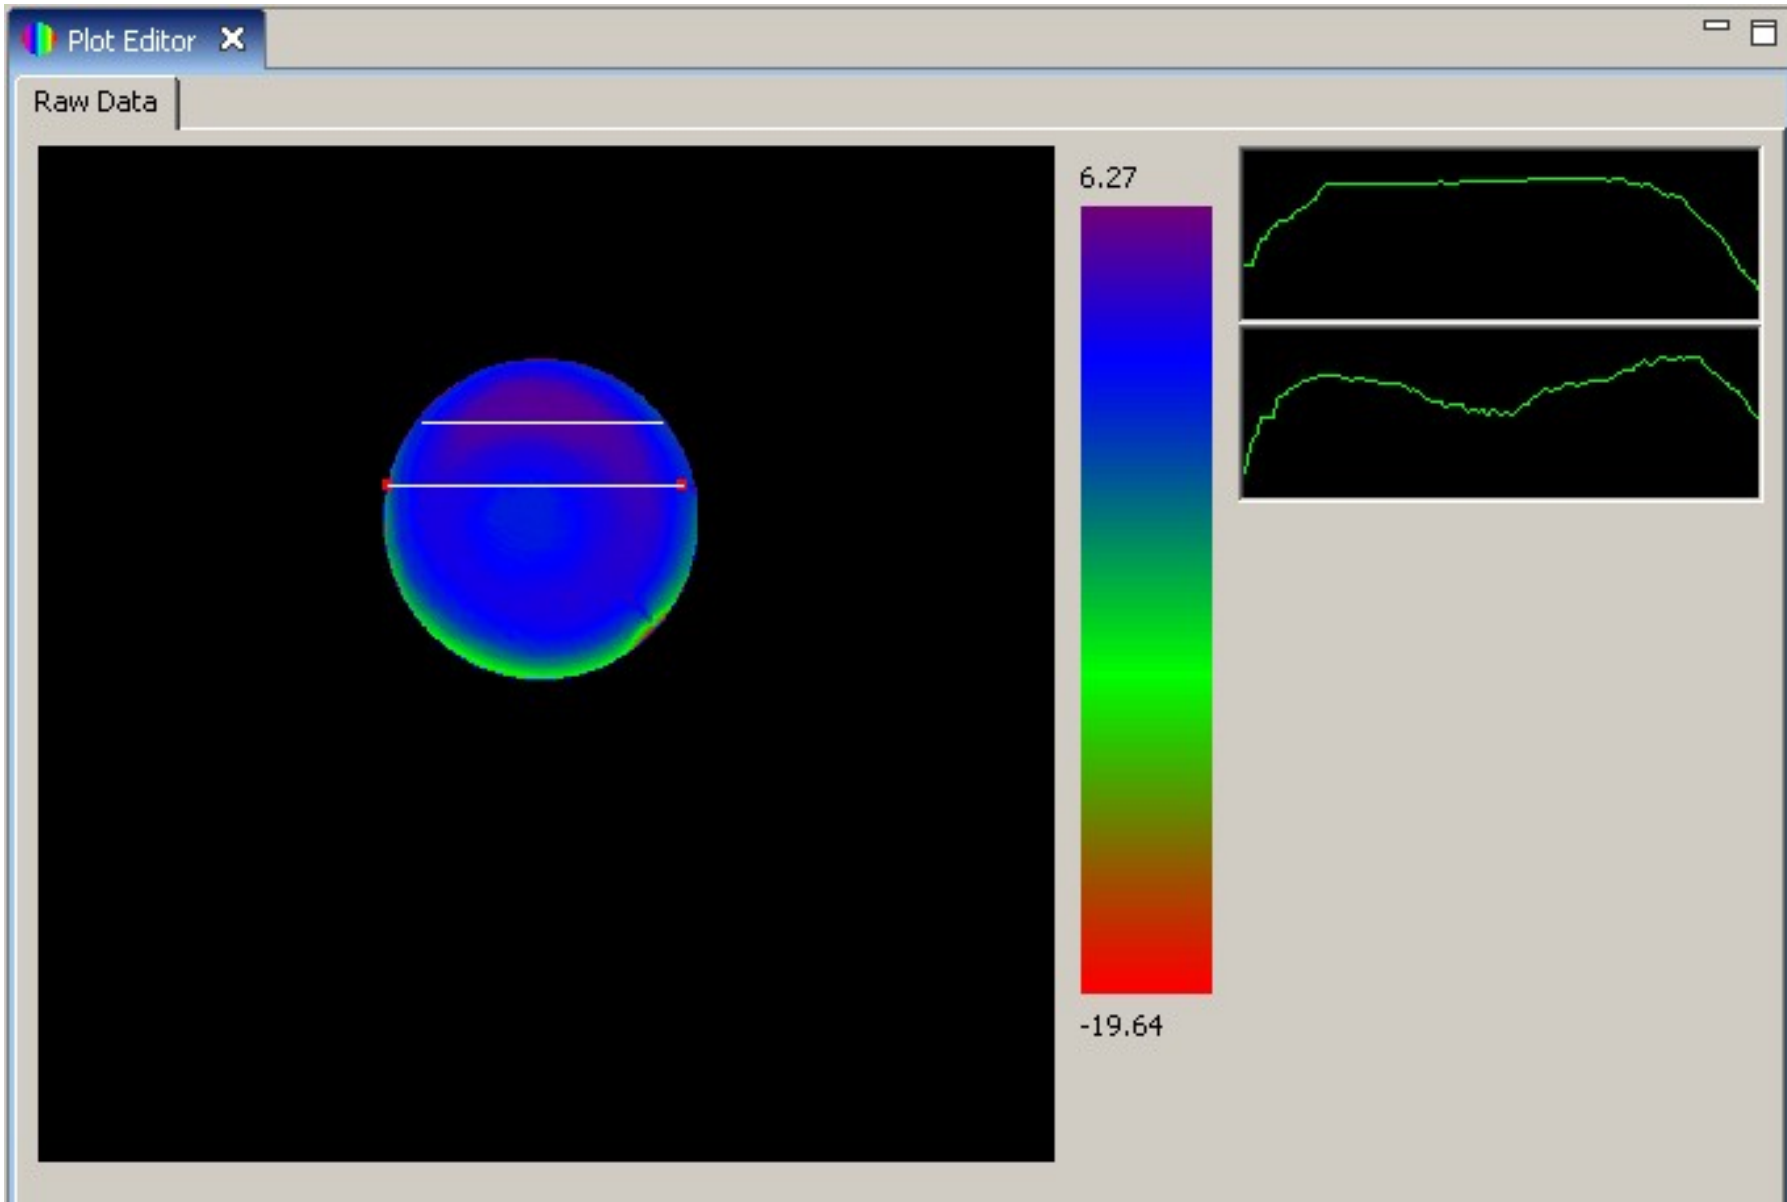

- Base plugins are:
 - **imtek.optsuite.base** (application)
 - **imtek.optsuite.acquisition**
 - Interfaces for data model and I/O
 - Extension-points for hardware interfaces (measurement tools)
 - Extension-points for acquisition (algorithms)
 - Model and extension points for data masking
 - **imtek.optsuite.analysis**
 - Analyser framework (compute new data based on measured)
 - Interfaces and base for plotting
 - Basics for data statistics and reporting

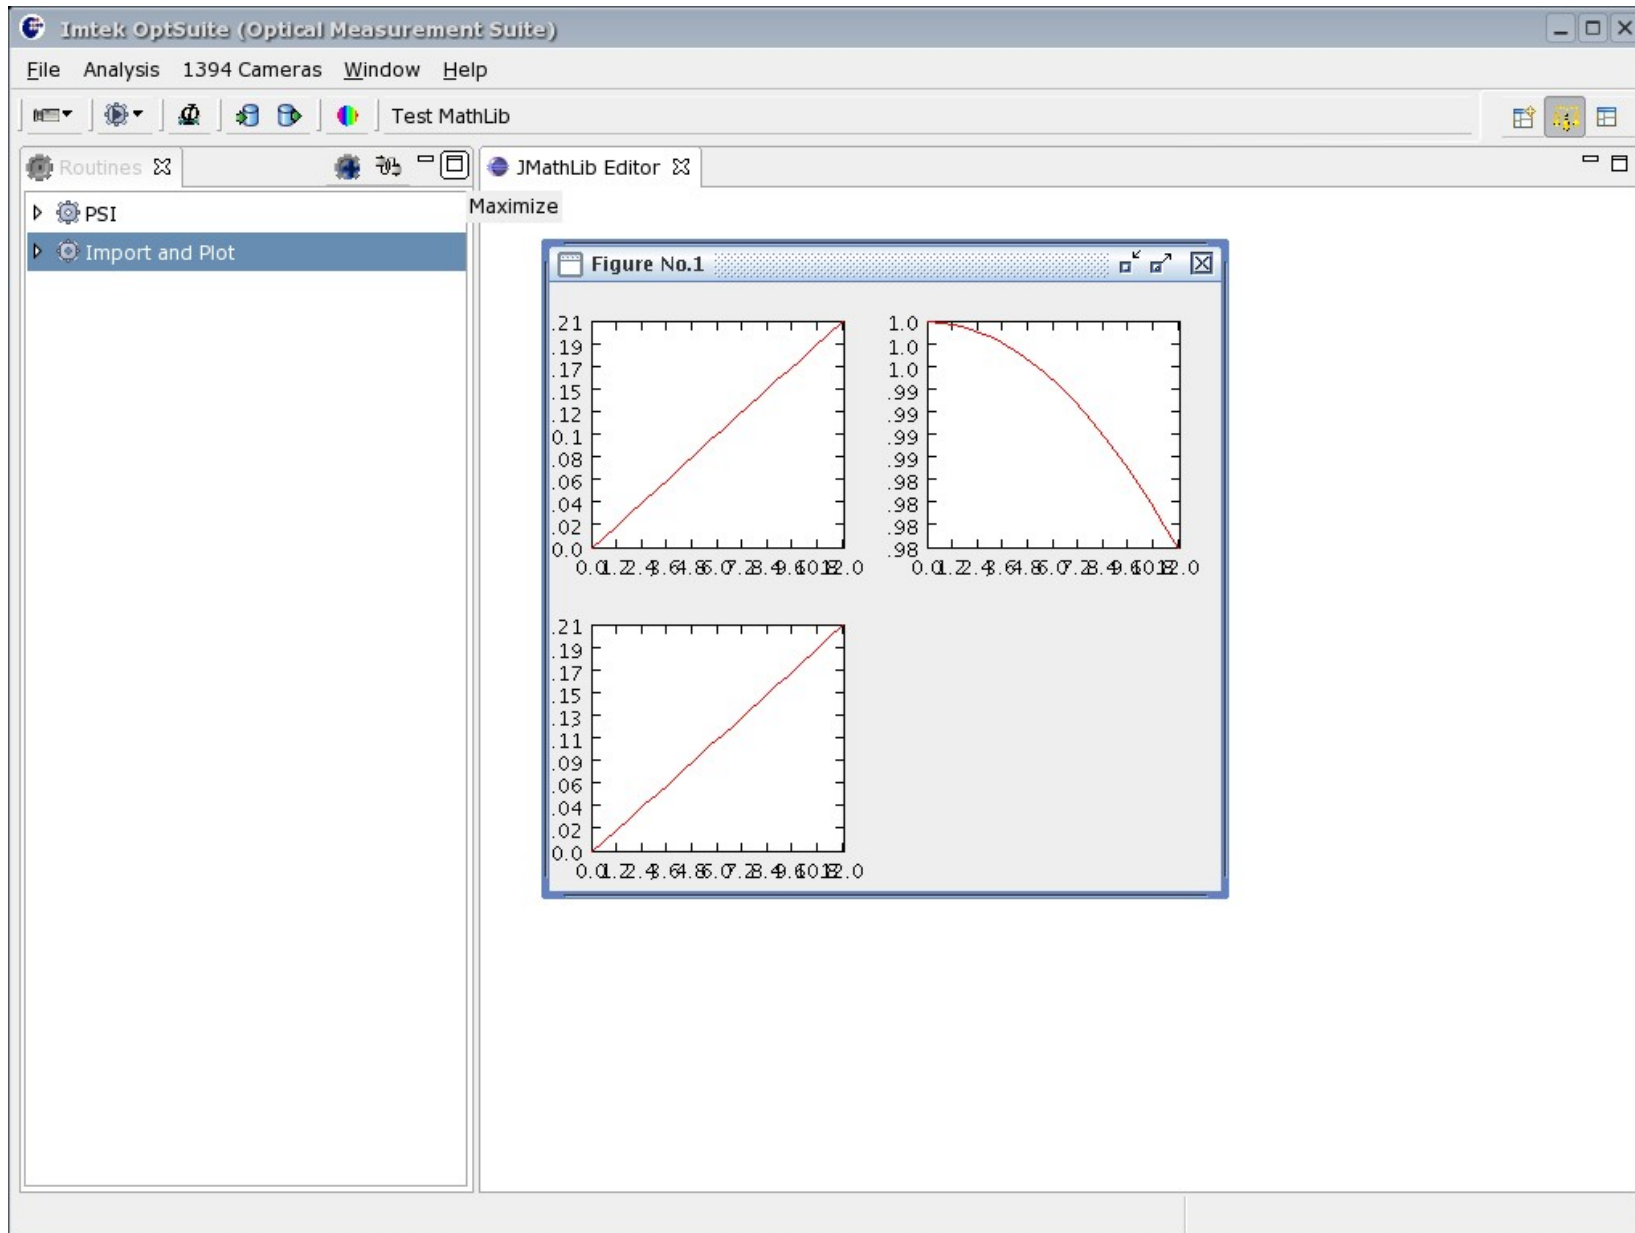

- Sattelite plugins (providing measurement-tools):
 - **imtek.optsuite.jlibdc1394**
 - Framework for controlling firewire cameras
 - **imtek.optsuite.stagecontrol**
 - Framework for controlling linear stages
 - **imtek.optsuite.gpib**
 - Providing a GPIB interface for OptSuite
 - **imtek.optsuite.psi**
 - Algorithms and tools for phase shifting interferometry
 - **imtek.optsuite.oct**
 - Algorithms and tools for optical coherence tomography
 - **imtek.optsuite.jmathlib**
 - Integration of Open Source project JMathLib into Eclipse

- Mask Editor
 - Extension-point driven mask items and editor tools
 - Pluggable background providers
 - Last measured data
 - Live camera view
 - Ready to use implementations for
 - rectangular
 - elliptical / circular
- mask items

- Analysis & Display
 - Data analysers take acquired data and might manipulate it
 - Many applications
 - Averaging
 - Fitting
 - Unwrapping
 - ...
 - Plots take analysed data and display
 - Plots are routinesteps – edited through normal gui
 - Plot 1D and 2D components available (still in development)

- Thanks for your attention

- **CSS**
 - Nightly build system
 - NighLabs created Eclipse integrated NightLabsly build
 - Define Products (Like Features in Eclipse system)
 - Dependencies resolved automatically
 - Build and packaging of products automatically
 - Managment Interface
 - Also NightLabs is developing workstation based updates
 - See <http://jfire.org>

- **Collaboration**
