Chapter 2: Work Planning and Control

Quick Start Summary

1 Who needs to know about these requirements

The requirements of Work Planning and Control apply to all persons, including SLAC employees, subcontractors, and users, performing any activity-level work in or on facilities managed by SLAC, including technical and administrative activities, construction, experiments, operations, maintenance, and service. The chapter covers the stop work process as part of performing work within controls.

2 Why

Inconsistent and inadequate work planning, authorization, and control puts at risk adequate protection of workers, the public, and the environment.

3 What do I need to know

All work must first be planned, then authorized, and finally released. How this happens depends on the type of work, categorized by complexity: green, yellow, red. Work is authorized generally by the supervisor of the person performing the work. (Subcontractor supervisors authorize work, but a SLAC employee must confirm the authorization). Work is typically released by either the supervisor, for work performed in a person’s resident area, or, for non-resident area work, the area or building manager. Documentation requirements vary by type of work, but generally there must be evidence in some form of scope of work, authorization, and release to communicate critical steps, hazards, and controls to workers.

Every worker performing any work in or on facilities managed by SLAC has the authority and responsibility to stop work for conditions that threaten imminent danger. Stop work actions take precedence over all other priorities and procedures.

4 When

These requirements take effect 28 September 2018.

5 Where do I find more information

SLAC Environment, Safety, and Health Manual (SLAC-I-720-0A29Z-001)

Chapter 2

Work Planning and Control

1 Purpose

Work planning and control (WPC) is the use of formal, documented processes for identifying and mitigating risks when planning, authorizing, releasing, and performing work. The purpose of WPC is to ensure adequate protection of workers, the public, and the environment, which would otherwise be put at risk by inconsistent and inadequate planning, authorization, and control.

Following the principles of integrated safety and environmental management, WPC uses a graded approach to the level of coordination required to identify and mitigate hazards: the process varies according to the type of work (green, yellow, red), which is in turn based on the complexity and risk of the work.

This program covers the seven core functions of SLAC’s integrated safety and environmental management system (ISEMS):

1. Define the work
2. Identify and analyze hazards
3. Develop and implement controls
4. Authorize work
5. Release work
6. Perform work within controls
7. Feedback and continuous improvement

For all activity-level work performed in or on facilities managed by SLAC, including technical and administrative activities, construction, experiments, operations, maintenance, and service. It does not cover project management, scheduling, or budgeting. The program also covers the stop work process as part of performing work within controls. It does not cover project management, scheduling, or budgeting.

It applies to all workers (including SLAC employees, subcontractors, and users); supervisors; field construction and service managers; and area and building managers.

2 Roles and Responsibilities

Functional roles and general responsibilities for each are listed below. More detailed responsibilities and when they apply are provided in the procedures and requirements.
The roles may be performed by one or more individuals and one individual may play more than one role, depending on the structure of the organizations involved. Responsibilities may be delegated.

For detailed roles and responsibilities for construction work planning and control, see Work Planning and Control: Construction Work Planning and Control Procedure.

### 2.1 Worker

- Completes required training
- Understands scope of work, hazards, and controls (based on training and authorization and release)
- Performs only work within the scope of work, for which hazards, controls, authorization, and release have been granted
- Ensures that controls are in place and hold points, if any, are clearly understood and validated before starting work
- Works within controls
- Stops the work and notifies supervisor if conditions change or work details differ from the work plan to the point that a safety concern arises
- Provides feedback, as appropriate, to improve work procedures or WPC processes

### 2.2 Work Planner

- Defines scope of work
- Identifies work groups necessary to fulfill scope of work
- Assists in preparation of work plans, including coordinating the work details and requisite reviews and identifying required permits and approvals
- Ensures that the work that is being planned will meet the requirements of the work request

### 2.3 Supervisor

The SLAC employee functioning as the supervisor:

- Reviews work requests, as appropriate, assigns work, and ensures work plans are developed
- Ensures the assigned task(s) is documented as needed to minimize unintended consequences

Requirements for documentation vary with the type of work. It is important to remember that the purpose of documentation is to address and communicate to the worker unique or specific hazards resulting from the condition of the equipment being worked on, the location of the work, the significance of negative consequences if an intermediate step is omitted or performed out of sequence, and so on. (See Work Planning and Control: Work Planning and Control Procedure for more detail on required and recommended documentation.)

- Understands not only the activity-level hazards, but the hazards associated with the location where the work will be performed, and, if necessary, works with the area or building manager who will be releasing the work
Authorizes work by ensuring
- Coordination with the functional or administrative supervisor, as appropriate
  The administrative supervisor is accountable for ensuring his or her workers are authorized, either by granting the authorization or delegating that responsibility to a functional supervisor. The authorizer must be sufficiently knowledgeable to understand the work, the hazards, how to identify controls, the experience necessary to carry out such work, and the competence of the worker.
- Work planning is current and complete
- Persons assigned to perform work are qualified
  Supervisors are required to ensure workers are properly trained before authorizing them to perform work and to review training assignments annually and when job activities or workplace hazards change. Current training can be checked using the SLAC Training Assessment (STA).
- Persons assigned to perform the work understand the hazards and controls
  The Stanford University Administrative Guide Memo 7.5.1, “Health and Safety Performance Standards and Discipline”, which SLAC follows, requires supervisors to communicate clearly health and safety practices to all employees and to make good health and safety practices part of employees’ job expectations and evaluations.
- Adequate controls are in place or will be in place before executing the work
  - Releases resident area work, if he or she controls the area (otherwise release by the area or building manager is required)
  - Ensures a tailgate briefing, if required, is held
  - Ensures that work is performed as planned
  - Reviews changes, brought to his or her attention, to work scope and determines the level of re-authorization and re-release required. Partners with functional or administrative supervisor, as needed.
  - For imminent danger stop work, ensures appropriate parties are notified, situation resolved, hazards and controls updated, and any necessary re-authorization and re-release obtained
  - Reviews completed work for potential process improvements or lessons learned

2.4 Field Construction Manager / Service Manager / Point of Contact

The subcontractor’s foreman/supervisor authorizes work but a SLAC employee confirms the authorization: a field construction manager (FCM) for construction subcontractor work, a service manager (SM) for high-risk service subcontractor work, or a point of contact (POC) for all other types of subcontractor work

- FCMs releases construction subcontractor work directly (see Work Planning and Control: Construction Work Planning and Control Procedure); SMs and POCs first obtain the release from the area or building manager then release the subcontractors
2.5 **Subcontractor**

- Provides qualified workers
- The subcontractor’s foreman/supervisor authorizes work but a SLAC employee confirms the authorization
- Subcontractor work is released by a SLAC FCM, SM, or POC, depending on the type of work

2.6 **Area / Building Manager**

- Releases work in areas where work is to be performed by non-resident workers

  For construction projects, the area or building manager releases the work to the FCM, who then has release authority until the project is complete. Once the construction project is complete, the building or area is handed back to the building or area manager. See *Work Planning and Control: Construction Work Planning and Control Procedure* for details.

  For other types of subcontractor work, the area or building manager releases the SM or POC, who in turn releases the subcontractor.

2.7 **ESH Coordinator**

- Reviews and approves work plans as appropriate for hazards and adequate controls
- For imminent danger stop work, or upon request, concurs with restart of work if satisfied with updated controls

2.8 **Division / Department Head**

- Implements WPC within his or her respective organization
- Ensures implementation of WPC requirements is documented, with concurrence from the WPC program manager, if local implementation differs from this program (for example, see *Work Planning and Control: SSRL User Implementation for User Experiments*)
- Ensures a mechanism is in place to encourage and document feedback for continuous improvement
- For imminent danger stop work, notifies the chief safety officer (CSO) and associate laboratory director (ALD), ensures investigation is initiated within one work day, concurs with restart of work if satisfied with updated controls, and uses and shares information to prevent similar situations from happening again. Ensures that appropriate division/department communication occurs to inform workers of the stopped work, reasons for it and a path forward

2.9 **Associate Laboratory Director**

- Is accountable for effective WPC implementation within his or her directorate
- Approves planning of projects with lab-wide impact (for example projects that if inadequately planned may cause 911 phone service to go down, interruption of major scientific programs/operations, and so on)
When notified about stop work, ensures adequate communication throughout appropriate departments within directorate. If imminent danger stop work, or upon request, authorizes restart of work if satisfied with updated controls; confirms a new release has been granted before work is started; and informs laboratory director and the DOE SLAC Site Office of status.

2.10 ESH Division

- Supports line management with hazard identification and evaluation and implementation of appropriate controls

2.11 ESH Division Director / Chief Safety Officer

- For imminent danger stop work, or upon request, concurs with restart of work if satisfied with updated controls

3 Procedures, Processes, and Requirements

These documents list the core requirements for this program and describe how to implement them:

- **Work Planning and Control: Work Planning and Control Procedure** (SLAC-I-720-0A21C-002). Describes process for planning, authorizing, and releasing non-construction work

- **Work Planning and Control: Construction Work Planning and Control Procedure** (SLAC-I-720-0A21C-005). Describes process for planning, authorizing, and releasing construction work

- **Work Planning and Control: Stop Work Procedure** (SLAC-I-720-0A21C-003). Describes process for initiating and restarting imminent danger stop work

- **Work Planning and Control: Area Hazard Analysis Procedure** (SLAC-I-730-0A21C-026). Describes process for developing and using area hazard analyses

This site provides useful tools:

- **Work Planning and Control** (includes online tools)

4 Training

4.1 Worker

The following course is mandatory for SLAC employees who perform non-green work:

- ESH Course 120, Work Planning and Control Overview (**ESH Course 120**)

The following course is mandatory for SLAC employees who perform green work in non-office areas:

- ESH Course 121, WPC Overview for Green Workers in Non Office Areas (**ESH Course 121**)

Users, department associates, students, and subcontractors are not required to take these courses. The SLAC employee who authorizes their work must take one of the courses, as appropriate.
4.2 Authorizer / Releaser

The following course is mandatory for all building and area managers, project managers, FCMs, SMs, and POCs, direct supervisors of SLAC employees who perform non-green work, and those SLAC employees who authorize the work of any other worker at SLAC:

- ESH Course 120, Work Planning and Control Overview (ESH Course 120)

The following course is mandatory for all building and area managers, project managers, FCMs, and Health and Safety Services staff involved with construction activities:

- ESH Course 392, Construction Work Planning and Control (WPC) (ESH Course 392)

5 Definitions

**activity.** A subset of a project describing floor-level work, comprising one or more tasks

**activity and training authorization (ATA).** Document describing activities, boundary conditions, hazards, controls, and training requirements

**activity/work planner.** Individual who assists with the development of the work plan, including coordinating the work details and requisite reviews and identifying required permits and approvals

**area hazard analysis (AHA).** A process for identifying, documenting, and communicating area manager and building manager contact information; PPE, training and green release access requirements; and hazards and controls that require a worker’s action in order to enter the area or to consider during planning of work in the area

**authorization.** Affirmation by a supervisor that a worker is trained and qualified and has been informed of the hazards and controls of activities he or she has been assigned (see also release)

**control.** Preventative measure – hazard elimination, engineered, administrative, or personal protective equipment – applied to an activity for the purpose of protecting people, the environment, and property

**danger, imminent.** A hazard or situation which, if allowed to persist, is likely to cause an accident that will result in death, serious injury, significant property damage, or environmental impairment

**danger, non-imminent.** A hazard or situation which, if allowed to persist, is unlikely to cause an accident that will result in death, serious injury, significant property damage, or environmental impairment. However, the potential outcome of allowing the hazard or situation to continue is unacceptable.

**hazard.** Anything with the potential to cause harm to people, the environment, or property

**job safety analysis (JSA).** Technique (and document) that identifies the tasks associated with a job and the related hazards and the controls to eliminate or reduce them to an acceptable risk level. The analysis focuses on the relationship between the worker, the task, the tools, and the work environment.

**manager, area.** Person designated by line management who is responsible for a defined area of a given building. These areas generally contain experimental and/or industrial equipment and are associated with
special hazards. Not all buildings have an area manager, and other buildings, such as the linac accelerator housing and klystron gallery, may have several.

**manager, building.** Designated SLAC employee who serves as the point of contact for all activities that affect the conventional facilities of the assigned building. The building manager also has oversight responsibility for ESH requirements related to the non-programmatic facilities and activities of that building.

**qualified.** Having the practical skills necessary to perform an activity in a safe and environmentally responsible manner and being trained, certified, and licensed as required

**release.** Acknowledgement that proposed work activities do not interfere with programmatic or conventional facilities; have been coordinated with adjacent building/area managers, as appropriate; affected occupants have been informed of potential disruption or inconvenience; worker(s) have been informed of unique hazards, controls or limitations of the area; any boundary conditions have been communicated (see also authorization)

**requester.** Individual who requests work to be done

**resident area.** Area, inside or outside a building, where a worker performs much of his or her day-to-day activities and where the supervisor typically has authority to release work

**risk.** Quantitative or qualitative expression of possible harm or loss that considers both the probability that an event will occur and the consequence of that event

**SLAC Training Assessment (STA).** A tool to assign and track SLAC training. The STA allows both employees and management to quickly understand training requirements, ensure that training is completed in a timely manner, and ensure that training remains current

**standard operating procedure (SOP).** A pre-approved, job-specific procedure that describes the complete work scope; necessary work instructions, precautions, and prerequisites; hazards associated with the job; and the hazard controls to be implemented in order to prevent accidents, injuries, and property damage

**stop work.** A definitive statement made openly that an imminent danger is present and all related activities must stop immediately or that an assigned task poses risk of death or serious injury and will not be performed. Stop work may also be executed for non-imminent danger situations that may be resolved by an informal discussion with or without authorizing supervisor’s involvement.

**supervisor.** Knowledgeable SLAC employee responsible for authorizing and overseeing work. In the case of users, students, and so on, a knowledgeable SLAC employee functions as the supervisor for purposes of authorizing work and ensuring that the worker understands release requirements. The authorizing supervisor may be the administrative or functional one, but it must be documented and clear to the worker who it is.

**supervisor, administrative.** Designated manager or supervisor who manages performance and assigns training. Responsible for authorizing work, unless delegated to a functional supervisor in such a manner that it is clear to the worker who is authorizing their work.

**supervisor, functional.** A SLAC employee who has the knowledge or skill to identify hazards and controls and to provide oversight of work. A worker may be temporarily assigned to a functional supervisor to support a specific project or for a specified time period.
tailgate briefing. Review by workers and their supervisor of an activity immediately before release to ensure worker understanding of the interdependent hazards and controls, hold points, unique area hazards, and agreement on how to execute the work. Work planning meetings where multiple work groups’ or departments’ work activities are coordinated and released.

user. A scientific researcher engaged on approved research projects using DOE-designated user facilities (for example, SSRL, LCLS, FACET)

work group. A trade, for example, riggers, vacuum technicians, electricians, or group of workers who have the same supervisor

work integration plan (WIP). Document summarizing planning and coordination of red work and granting release

work plan. Compendium of documents required to direct the execution of the work, including scope of work, project plans, hazards, controls, authorizations, and releases. Examples are an ATA; a JSA including a release; or SOP, permits and a release.

work, green. Work limited to those technical or administrative activities commonly performed by the public, posing well known hazards, with controls that may be implemented without permits or special ESH training, excluding training required to simply access an area. Examples are performing routine office work, using office supplies, reviewing schematics or specifications, using GPS or Hilti measuring devices, using a microscope, taking photos, performing field verifications or ESH observations, and operating break room appliances. Also referred to as office work.

work, yellow. Non-green work performed in one’s resident area. Also work performed outside one’s resident area requiring two or fewer work groups working simultaneously or requiring two or fewer permits or plans. Work performed outside one’s resident work area is typically initiated by a supervisor or through a work request.

work, red. Work that requires detailed planning and coordination because of the number of interdependent controls and/or different work groups required to complete the scope of work. Red work is any that requires three or more permits or plans, or three or more work groups working simultaneously. Also referred to as complex work. Examples are projects involving 1) coordination among three or more departments, crews, and/or craft types that must work simultaneously; 2) a complex and relatively infrequent task (like moving a huge piece of marble onto a beam line); 3) tree trimming, servicing elevators, and environmental remediation.

worker. Individual who will perform an activity. Individuals include SLAC employees, subcontractors, users, students, interns, department associates, Department of Energy (DOE) employees, or anyone performing any activity in or on facilities managed by SLAC

Chapter 2: *Work Planning and Control*

**Work Planning and Control Procedure**

Product ID: 451 | Revision ID: 2025 | Date published: 28 September 2018 | Date effective: 28 September 2018

1. **Purpose**

The purpose of this procedure is to ensure adequate protection of workers, the public, and the environment, through the consistent, effective, planning, authorization, and release of activity-level work. It covers the seven core functions of SLACs’ integrated safety and environmental management system (ISEMS):

1. Define the work
2. Identify and analyze hazards
3. Develop and implement controls
4. Authorize work
5. Release work
6. Perform work within controls
7. Feedback and continuous improvement

For all *activity*-level work performed in or on facilities managed by SLAC, including technical and administrative activities, experiments, operations, maintenance, and service. It does not cover project management, scheduling, or budgeting. For construction, see [Work Planning and Control: Construction Work Planning and Control Procedure](http://www-group.slac.stanford.edu/esh/eshmanual/references/wpcProced.pdf).

It applies to all workers (including SLAC employees, subcontractors, and users); their supervisors; field construction and service managers; and area and building managers.

2. **Procedures**

2.1 **Planning, Authorization, and Release**

Three key concepts of work planning and control are planning, authorization, and release. Before beginning actual work, all work must first be planned, then authorized, and finally released. The following section defines these concepts; Section 2.2 summarizes how they are implemented for different types of work; and Sections 2.3 and 2.4 provide detailed procedures.

2.1.1 **Planning**

*Planning* consists of defining the scope of work, identifying and analyzing the hazards, and developing and implementing controls. Identifying and analyzing hazards and controls related to both the activity and the
work area where the activity will occur are the responsibility of the person authorizing the work. A visit to the job site may be warranted, as well as a discussion with the area or building manager and review of any area hazard analysis (AHA). The results are documented in some form of work plan, which forms the basis for authorization and release.

2.1.2 Authorization

Authorization means that the person who authorizes the work

1. Is sufficiently knowledgeable of the hazards to plan and authorize such work
2. Has determined the work falls within his or her area of responsibility
3. Is satisfied with the content of the work plan
4. Has determined that the persons assigned to perform work are qualified
5. Has discussed hazards and controls with those persons

The person who authorizes work is accountable for its performance. Work is typically authorized by the supervisor of the person performing the work.

Most work at SLAC is authorized by a knowledgeable SLAC employee supervising other SLAC employees. For construction subcontractor or high-risk service subcontractor work, the subcontractor’s foreman/supervisor authorizes the work but the SLAC field construction manager (FCM) or the service manager (SM), respectively, confirms the authorization. (See Work Planning and Control: Construction Work Planning and Control Procedure for details on construction.) The SLAC point of contact (POC) confirms all other types of subcontractor work.

Note: For workers matrixed to another organization, a clear hand off of authorization responsibilities must be initiated by the administrative supervisor to ensure that both the functional supervisor and the worker know who is responsible for authorizing work. Workers who are unclear as to who is authorizing their work should ask their administrative supervisor for direction.

The key, unvarying, requirement for authorizing work is that the person authorizing the work ensures that the persons doing the work

1. Understand the scope of work and the task-specific hazards and controls
2. Are qualified

Note: Supervisors are required to ensure workers are properly trained before authorizing them to perform work and to review training assignments annually and when job activities or workplace hazards change. The Stanford University Administrative Guide Memo 7.5.1, “Health and Safety Performance Standards and Discipline”), which SLAC follows, requires supervisors to communicate clearly health and safety practices to all employees and to make good health and safety practices part of employees’ job expectations and evaluations.

2.1.2.1 Documentation

Requirements for documenting authorization vary with the type of work (see Section 2.2). It is important to remember that the purpose of documenting authorization is to address and communicate to the worker unique or specific hazards resulting from the condition of the equipment being worked on, the location of
the work, the significance of negative consequences if an intermediate step is omitted or performed out of sequence, and so on.

When deciding how and whether to document authorization, the following factors should be considered, regardless of the type or location of the work:

- Injury and illness rates at SLAC (see CAS Dashboards)
- Potential to cause severe or disabling injuries or illness, even if there are no previous events
- Possibility of one, simple human error leading to a severe event
- Familiarity with the process/changes in process
- Complexity of the task(s)
- Frequency of encountering the hazards or controls
- Existence of specific or unique personal protective equipment (PPE) requirements

2.1.3 Release

Release means permission to proceed with authorized work in a given area or on a given project. Release is granted after the person granting the release has made sure that

1. Hazards unique to the area have been communicated
2. Affected persons have been notified
3. Work has been coordinated to avoid conflict and minimize risk

Work performed in a person’s resident area is typically released by the supervisor; non-resident area work by the area or building manager. For work in a resident area not under the supervisor's control, release is also granted by area or building manager.

For construction work, the area or building manager typically transfers responsibility for daily release to the FCM, who then releases work to the subcontractor. (See Work Planning and Control: Construction Work Planning and Control Procedure for details.)

2.2 Authorization and Release by Type of Work

How work is planned, authorized, and released depends on the type (green, yellow, or red) and the location (office/non-office and resident/non-resident area). The following is a summary of requirements; detailed procedures are given in Sections 2.3 and 2.4.

1. Green work is administrative or technical in nature and does not require any permits or special ESH training (for example, for fall protection). Green work is authorized by the completion of required new employee/worker safety training. Green work in office areas is released with the same required new employee/worker safety training. Green work in a non-office area (that is, an industrial area) requires release by the area or building manager, if required on the area hazard analysis (AHA) or other postings. Otherwise, if the worker is familiar with the area, has read the AHA, has no ESH concerns, and adheres to all postings, he or she may enter the area to perform green work.

2. Yellow work in the worker’s resident area is authorized and released with an up-to-date SLAC Training Assessment (STA) and supervisor acknowledgment of worker’s ability to carry out assigned
work. Documenting routine hazards and controls is not required. Supervisors are free to use a job safety analysis (JSA), standard operating procedure (SOP), or activity and training authorization (ATA), but they do not have to.

When a worker is dispatched outside his or her resident area, a JSA or SOP is typically required for authorization, and the work is released by the area manager, if there is one, otherwise by the building manager. (Release by an area or building manager is also required for work in resident areas, if the area is not under the control of the worker’s supervisor.) For work involving subcontractors, a tailgate briefing is also required as a final release before beginning any activity.

Some simple activities performed outside a worker’s resident area may be authorized without a JSA or SOP, as determined by the supervisor. For example, climbing a ladder (which is yellow work) to perform green work. For activities like this workers are expected to show sound judgment; requiring written authorization in the field would not add value and might even distract the worker’s focus on the hazards and controls for the task at hand (see Section 2.1.2.1). A work release is, however, still required from the appropriate area or building manager.

3. Red work is authorized at the activity level like non-resident yellow work (that is, by the supervisor of the workers involved, using a JSA or SOP). In addition, the planning efforts are documented by the work planner with a work integration plan (WIP); a coordination meeting is held to discuss the activities, timing, permits, and so on until the area manager is satisfied that release may be granted; and, unless all workers are present at the coordination meeting, a tailgate briefing is required to release work for each worker before beginning any activity. For work that is considered to have lab-wide impact, the associate laboratory director (ALD) of the planner must indicate concurrence of adequate planning by signing the WIP. For the authorization and release of construction work, see Work Planning and Control: Construction Work Planning and Control Procedure.

### 2.3 Green Work Procedure

Green work is authorized and released by workers and their supervisors following this procedure.

<table>

<tr>
<td>1.</td>
<td>Worker</td>
<td>For green work in an office area, completing training serves as the release</td>
</tr>
</tbody>
</table>
| | | For green work in a non-office area (that is, an industrial area):
| | | In areas posted with access/release/training (and additional ESH/PPE requirements, including area hazard analyses [AHAs]), adherence to the posted requirements serves as the release (unless release by an area/building manager is required in the postings).
| | | In the absence of an AHA or similar posting:
| | | If familiar with the hazards of the area, new employee/worker safety training serves as the release. Examples of SLAC organizations that are expected |
to be aware of such hazards include Radiation Protection Field Operations staff, Facilities electricians/mechanics, and Power Conversion technicians.

- If not familiar with the area hazards or has questions, worker contacts the area manager, if there is one, or the building manager, before entry, who will inform the worker of unique hazards and subsequent controls, as well as potential conditions of entry, before granting a release.

For green work in areas designated as construction sites, a release is granted by adhering to the construction site access requirements.

For groups of visitors, tour groups, photo opportunities, lab-wide events (for example, Kids Day and holiday parties) and other activities similar to these, a release is required from the area manager, if there is one, otherwise the building manager.

<th>Person / Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Requester</td>
<td>Identifies the need for work to be done and submits a request for the work to be performed to service provider, with the following information: Name and department of requester Location of work to be performed Description of service/work needed Any special instructions, considerations, known area hazards, and access requirements/training Charge number, if required</td>
</tr>
</tbody>
</table>
### Plan - Identify and Analyze Hazards and Develop and Implement Controls

<table>
<thead>
<tr>
<th>Step</th>
<th>Person / Function</th>
<th>Action</th>
</tr>
</thead>
</table>
| 2.   | Planner           | Develops work plan by:  
- Determining how best to perform the work, involving, where practical, workers likely to perform the work and, as appropriate, subject matter experts (SMEs)  
- Defining procedures required by manufacturers of specialized equipment or specialized installation sequences  
- Defining testing and acceptance criteria  
- Evaluating those steps that may pose unacceptable consequences if performed out of sequence, if omitted, or if an undesired outcome occurs (for example, a part gets jammed or equipment breaks)  
- Ensuring the work plan is reviewed for ESH concerns  
Steps, hazards, and controls are documented as follows:  
For yellow resident work  
Not required  
For yellow non-resident work  
Job safety analysis (JSA) or standard operation procedure (SOP), plus required permits. (At the discretion of the authorizing supervisor, an ATA may be used in place of a JSA or SOP.)  
Note some simple activities performed outside a worker's resident area, such as climbing a ladder to perform otherwise green work, may not require documentation, as determined by the supervisor (see Section 2.2).  
For red work  
JSA or SOP for the work + work integration plan (WIP). Note for work that is considered to have lab-wide impact, the ALD of the planner must indicate concurrence of adequate planning by signing the WIP.  
Plus all required permits, plans, and other specifications (see the Hazard Evaluation and Planning eTool for identifying SLAC ESH permits, plans, and other requirements)  
| 3.   | Authorizer        | Ensures the work plan is current and that the following actions occur:  
- Affirming the planned work has been reviewed and approved, as appropriate  
- Ensuring the analysis of relevant hazards is current  
- Obtaining the necessary permits and ensuring conditions have been met  
- Identifying qualified workers  
- Identifying necessary material and equipment  
Note walking the specific area and surrounding areas where the work is to be performed may be required to understand fully the hazards and necessary controls.  
| 4.   | Authorizer        | Authorization  
Reviews and authorizes work, if satisfied that  
- The work plan is complete and current  
- The persons assigned to perform work as defined in the plan are appropriately trained, qualified, certified, and licensed and he or she has discussed the
## Step 4: Authorization

<table>
<thead>
<tr>
<th>Person / Function</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person who authorizes the work is accountable for its performance.</td>
<td>Authorization is documented by</td>
</tr>
</tbody>
</table>

### For yellow resident work

**Supervisor** is not required to document hazards and controls provided the worker is current with STA requirements and understands scope of work, hazards and controls of assigned work (but see Section 2.1.2.1 for guidance on when documentation may be appropriate).

### For yellow non-resident work

**JSA or SOP**

**Evidence of authorization:** JSA or SOP cover sheet signed by the supervisor and each worker. For subcontractor work, the foreman or superintendent authorizes the work. The SLAC POC confirms the authorization by reviewing the JSA or SOP cover sheet.

JSA or SOP cover sheet only needs to be signed once for each job, unless it is changed.

Note some simple activities performed outside a worker’s resident area, such as climbing a ladder to perform otherwise green work, may be authorized without a JSA or SOP, as determined by the supervisor (see Section 2.2).

### For red work

**Evidence of authorization:** JSA or SOP cover sheet signed by the supervisor and each worker. For subcontractor work, the foreman or superintendent authorizes the work. The SLAC SM confirms the authorization by reviewing the JSA or SOP cover sheet.

JSA or SOP cover sheet only needs to be signed once for each job, unless it is changed.

Plus all required permits, plans, and other specifications (see the [Hazard Evaluation and Planning eTool](https://www.hazardevaluationandplanning.com) for identifying SLAC ESH permits, plans and other requirements).

## Step 5: Release

### For yellow resident work

**Supervisor** releases work, if he or she controls the area, via a valid STA and discussion of work tasks and associated hazards and controls with worker.

### For yellow non-resident work

**Area or building manager** releases work either orally or in writing. If orally, worker must annotate the JSA/SOP cover sheet with release information. If there is an area manager, he or she releases the work. If there is no area manager where work is taking place, then the building manager releases work.

For subcontractor work, the POC secures a release from the area manager, if there is one, otherwise the building manager, and subsequently holds a documented tailgate meeting to release the subcontractors.

### For red work

**Area or building manager** reviews the WIP, coordinates release-related details, and concurs that work may proceed by signing the WIP.
### Step 6: Worker and authorizer

**Authorizer** ensures a tailgate briefing occurs before start of work with workers and others as appropriate, to ensure that workers understand the work underway in the area and its hazards and controls, including when to verify controls are in place before continuing work activity. Repeats this briefing for any worker who arrives after the initial one.

If any worker does not agree that the hazard controls are adequate or if there are any other scheduling or ESH concerns, work must not be started.

On completion of the tailgate briefing, further releases the work for his or her workers to execute.

Evidence of a tailgate briefing must be available for all red work to document that individuals who attend the meeting understand the work and its inherent hazards and controls:

- **Non-construction Tailgate/Release Form** is used to document final release by SLAC of red work

### Step 7: Worker and authorizer

**Work Execution**

**Worker** ensures that controls are in place and hold points, if any, are clearly understood and validated before starting work. Only work that is part of the scope of work, for which hazards, controls, authorization, and release have been granted, may be performed.

**Authorizer** ensures that work is performed as detailed in the work plan

**Authorizer** ensures that the complete work plan, with all pertinent documentation, is available for reference at or near the work site

### Step 8: All workers

**Stop Work**

Anyone observing unsafe conditions or actions should approach and notify the worker in a way that minimizes a potential startle hazard. When requested to stop work, worker should safely stop the activity being executed.

If at any time conditions change or work details differ from the work plan to the point that a safety concern arises, workers must stop the work and notify their supervisor. Examples of such changes are

- Change in work scope (change in sequence or footprint, different parts, intermediate outcomes not as expected)
- Change in start or stop dates or times
- Change in work location
- Changes that increase or introduce new hazards or environmental impacts

**If the change does not create an imminent danger,** work may be restarted after
### Chapter 2 | Work Planning and Control Procedure

**Step** | **Person / Function** | **Action**
--- | --- | ---
 |  | **work plan documents have been updated and the work re-authorized and re-released, as deemed appropriate by the supervisor. See the Work Planning and Control: Stop Work Procedure.**
 |  | If the change creates an imminent danger, or a serious hazard that requires immediate attention is observed or a task is assigned that poses risk of death or serious injury, an imminent danger stop work must be initiated, as described in Work Planning and Control: Stop Work Procedure.

| 9. | Worker | **Hazard Control**
| |  | At the completion of each day's work, ensures that any hazards to others remaining in the work area where the work was performed are controlled
| |  | This can be done by the application of an administrative lock, posting and/or barricading the area, or performing housekeeping to return the area to a secure state.

| 10. | Authorizer | **Final Completion of Work**
| |  | Ensures the work site is left in a clean and safe condition

**Feedback and Continuous Improvement**

| 11. | Worker and authorizer | **Lessons Learned**
| |  | Supervisor should solicit and review feedback to determine if a lessons learned item or an opportunity for continuous improvement has been identified. If a lessons learned item is identified, incorporates it into the SLAC lessons learned database.
| |  | Worker should provide feedback, as appropriate, to improve work procedures or WPC processes.

| 12. | Authorizer / project manager / requester | **Closeout**
| |  | Once all work activities have been completed
| |  | **For yellow resident work**
| |  | Not required
| |  | **For yellow non-resident work**
| |  | Supervisor closes out work plan and retains for 90 days to enable review for lessons learned and WPC process improvements
| |  | **For red work**
| |  | Project manager/ requester closes out and retains for 90 days to enable review for lessons learned and WPC process improvements

### 3 Forms

Documentation requirements vary by type of work, but generally there must be evidence in some form of scope of work, authorization, and release. Such evidence includes meeting notes, a signed release, or even a phone conversation, with the result noted on some document. Leaving a voice mail or sending an e-mail, without obtaining a response, does not constitute evidence of a release.
Whether documentation is required or not, no one should forget that the purpose of the documentation is to ensure adequate planning, meet regulatory requirements, and most of all communicate critical steps, hazards, and controls to minimize unacceptable consequences.

These documents together with any others required to direct the execution of the work constitute the work plan. Note work plan requirements are cumulative, starting with the minimum documentation, adding JSAs or SOPs and permits for non-resident work, and work integration plans and tailgate briefings for high-risk yellow and all red work.

The following forms support this procedure:

- **Work Planning and Control: Activity Training and Authorization Form** (SLAC-I-730-0A21J-033). Form for documenting authorization and release of resident yellow work. Not required
- **Work Planning and Control: Job Safety Analysis Form** (SLAC-I-730-0A21J-034). Form for documenting authorization and release of yellow, red, and construction work
- **Work Planning and Control: SOP Authorization and Release Form** (SLAC-I-730-0A21J-035). Form for documenting authorization and release of yellow, red, and construction work
- **Work Planning and Control: Work Integration Plan Form** (SLAC-I-730-0A21J-036). Form for documenting planning, coordination, and release of complex/red work
- **Work Planning and Control: Non-construction Tailgate/Release Form** (SLAC-I-730-0A21J-038). Form for documenting final release of red work
- **Hazard Evaluation and Planning eTool**
- **SLAC Training Assessment (STA)**

### 4 Recordkeeping

The following recordkeeping requirements apply for this procedure:

- Red work packages must be kept by the project manager or FCM/SM for 90 days after the job is complete. Yellow work packages must be kept by the authorizing supervisor for 90 days after the job is complete.

Activity Training and Authorization Form

This form is used to document the authorization and release of resident yellow work. Its use is not required. (See Work Planning and Control: Work Planning and Control Procedure [SLAC-I-720-0A21C-002].)

<table>
<thead>
<tr>
<th>ATA Title:</th>
<th>ATA # (optional):</th>
<th>Start Date:</th>
<th>Valid Through (not to exceed 12 months):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department / Group Name:</td>
<td>Resident Bldg / Area Location(s):</td>
<td>Term Release(s) (if applicable):</td>
<td>Other Information or References:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Activity</th>
<th>Basic Hazards</th>
<th>Basic Controls, including boundary conditions (engineering, administrative, or PPE)</th>
<th>ESH Training, Qualifications, Skills, Certifications</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Acknowledgement** (worker): I will maintain compliance with my STA training requirements, including staying current with recertifications. I understand the type of activities I am authorized to perform and the associated hazards, controls, and boundary conditions. If I am unclear, I will ask my administrative supervisor.

<table>

Emergency Procedures
If life-threatening, call 911. Also call SLAC Site Security (ext. 5555) to report the incident. If non-life-threatening, contact the supervisor and PM and SLAC Site Security (ext. 5555) to report the incident. Seek first-aid treatment from the SLAC Occupational Health Center (Building 028). (See Emergency Management: Emergency Notification, Response, and Reporting Procedures.)

Work Release
Evidence of area/building manager release is available and all work is released (choose one):
- [ ] Fully and until the tasks are complete
- [ ] Until a specific hold point and/or a specific time period: (provide details):
- [ ] This specific portion/task is not released (provide details):
- [ ] None of the work is released (provide details):

As the [ ] project manager [ ] SM [ ] POC [ ] supervisor (or designee), I conducted this tailgate meeting, reviewed aforementioned topics, and addressed unique hazards of today's work with the list of personnel below. Final release to work is granted based on the stipulations noted above.

Name (print): Signature: Date:

Worker Acknowledgment
I understand today's scope of work and associated hazards and will ensure controls are implemented. I understand I have the authority to stop work, should I have questions or recognize a hazard that may not be adequately controlled.

<table>

SLAC National Accelerator Laboratory
Environment, Safety & Health Division
Chapter 2 | Non-construction Tailgate / Release Form
Chapter 2: Work Planning and Control

Construction Work Planning and Control Procedure

1 Purpose

The purpose of this procedure is to ensure adequate protection of workers, the public, and the environment, through the consistent application of work planning and control to construction work. It covers all construction work performed at SLAC; it does not cover project management, scheduling, or budgeting. It applies to workers, general and sub-tier subcontractors, SLAC project, field construction, and area and building managers, and the Environment, Safety and Health Division.

For information on the safety-related aspects of qualifying and managing contractors, see Chapter 42, “Subcontractor Safety”.

Note The process will be subject to a six-month trial period during which it will be evaluated and revised if needed. Please contact the program manager with questions or comments.

1.1 Work Planning and Control

Work planning and control (WPC) is the use of formal, documented processes for identifying and mitigating risks when planning, authorizing, releasing, and performing work. It covers the seven core functions of SLACs’ integrated safety and environmental management system (ISEMS):

1. Define the work
2. Identify and analyze hazards
3. Develop and implement controls
4. Authorize work
5. Release work
6. Perform work within controls
7. Feedback and continuous improvement

Three key concepts of work planning and control are planning, authorization, and release. Before beginning actual work, all work must first be planned, then authorized, and finally released.

Planning consists of defining the scope of work, identifying and analyzing the hazards, and developing and implementing controls. Identifying and analyzing hazards and controls related to both the activity and the work area where the activity will occur are the responsibility of the person authorizing the work. A visit to the job site may be warranted, as well as a discussion with the area or building manager and review of any
area hazard analysis (AHA). The results are documented in some form of work plan, which forms the basis for authorization and release.

Authorization means that the person who authorizes the work

1. Is sufficiently knowledgeable of the hazards to plan and authorize such work
2. Has determined the work falls within his or her area of responsibility
3. Is satisfied with the content of the work plan
4. Has determined that the persons assigned to perform work are qualified
5. Has discussed hazards and controls with those persons

The person who authorizes work is accountable for its performance. Work is typically authorized by the supervisor of the person performing the work. The key, unvarying, requirement for authorizing work is that the person authorizing the work ensures that the persons doing the work

1. Understand the scope of work and the task-specific hazards and controls
2. Are qualified

Release means permission to proceed with authorized work in a given area or on a given project. Release is granted after the person granting the release has made sure that

1. Hazards unique to the area have been communicated
2. Affected persons have been notified
3. Work has been coordinated to avoid conflict and minimize risk

Details on authorizing and releasing construction work are given below. For more on the general concepts of work planning and control and the details of non-construction work planning and control, see Chapter 2, “Work Planning and Control”.

2 Roles and Responsibilities

Functional roles and general responsibilities for each are listed below. More detailed responsibilities and when they apply are provided in the procedures and requirements.

The roles may be performed by one or more individuals and one individual may play more than one role, depending on the structure of the organizations involved. Responsibilities may be delegated.

2.1 Project Manager

- Manages overall project
- Ensures general and sub-tier subcontractors are following SLAC processes

2.2 Field Construction Manager

- Is the SLAC point of contact in the field for general and sub-tier subcontractors
Reviews job safety analysis (JSA) forms and daily tailgate forms approved by the general subcontractor
Releases construction subcontractor work on designated construction sites
Receives permit forms approved by the general subcontractor

2.3 Area / Building Manager
Releases construction subcontractor work in occupied buildings
May delegate release of construction subcontractor work in designated areas of occupied buildings to the FCM

2.4 ESH Division
Reviews subcontractor JSAs as needed
Receives plans and permits from FCM that have been submitted by the sub-tier subcontractor and approved by the general subcontractor

2.5 General Subcontractor
Provides qualified sub-tier subcontractors
Ensures sub-tier subcontractors follow SLAC’s construction WPC process
Ensures all subcontractor work is thoroughly planned
Approves JSAs, daily tailgates, and required permit forms submitted by sub-tier subcontractors and provides to SLAC field construction manager (FCM)
Conducts daily tailgate meetings

2.6 Sub-tier Subcontractor
Provides qualified workers
Foreman authorizes subcontractor work by signing the JSA and daily tailgate forms
Develops JSAs, daily tailgates, and required permit forms and submits to the general subcontractor for review and approval

2.7 Worker
Completes required training
Understands scope, hazards, and controls of planned work by reviewing and signing JSAs and daily tailgates and reviewing plans and permits
Performs only work within the scope that has been authorized by foreman, approved by the general subcontractor, and released by the FCM
Works within established controls documented in JSA, daily tailgates, and plans and permits
Stops work and notifies supervisor if conditions change or work details differ from the plan

3 Procedures

All work must be thoroughly planned and performed according to plan, as documented in JSAs, tailgate forms, and permits. The process is summarized below and illustrated in Figure 1.

3.1 Training

3.1.1 Worker

All construction workers must take ESH Course 375, Construction Safety Orientation (ESH Course 375) (See Chapter 55, “Site Access Control”, for more information on site access and on-boarding.)

Based on the tasks and hazards identified during planning, subcontractors may be required to complete additional SLAC-specific ESH training courses as determined by the project manager or FCM.

3.1.2 Supervisor

All construction subcontractor supervisors (foremen and superintendents) must attend Facilities Course 101, Subcontractor Safety Management Training (FAC Course 101), before approving any JSAs for work to be performed. The course will be presented by the Field Construction Management group.

3.1.3 SLAC

All FCMs must complete ESH Course 120, Work Planning and Control Overview (ESH Course 120).

All building and area managers, project managers, FCMs, and Health and Safety Services staff involved with construction activities must complete ESH Course 392, Construction Work Planning and Control (WPC) (ESH Course 392).

3.2 Authorization

Subcontractor work will be authorized by the foreman running the work for that trade. Work will be authorized by the foreman’s approval and signature on the JSA and daily tailgate form.

No work can be performed unless the foreman has included the job on the daily tailgate form and authorized the work.

3.3 Approval

General subcontractors will approve work to be performed by their representative’s signature on the JSA and daily tailgate form.
3.4 Release

The field construction manager for the job will provide daily release to the subcontractor by signing the daily tailgate form. There are three different types of release:

1. Dedicated Construction Site. This is a site that involves only construction. In this case, the FCM is the sole source for release of work on the job site.

2. Work in an Occupied Building. Involves work in currently occupied buildings where construction could impact building operation. In these cases the FCM must obtain release from the building or area manager before release of any work and must notify the building or area manager of any changes in planned work. The daily release must be a signature from the identified building or area manager or e-mail confirmation of the release.

3. Work in a Designated Area of an Occupied Building. This involves work in currently occupied buildings, but in a specific area or room. In these cases the building or area manager can turn over the area to the FCM who can then release work in that designated area for the duration of the project without the need for daily building/area manager release.

3.5 Complex or Unfamiliar Operations

When complex or unfamiliar operations are identified by SLAC, additional meetings will be required to ensure SLAC, the general subcontractor, and the sub-tier subcontractor performing the work clearly understand the work to be performed and the control measures needed to address the hazards.

The additional meeting(s) must be conducted before work release from the FCM.

3.6 Stop Work

All subcontractors must stop work in any of the following situations:

- When an imminent danger is discovered during the work
- When in the course of work it is discovered that proper planning has not been completed for the task
- When planned conditions have changed
- When work does not have the proper authorization, approval or release

Work cannot resume until the situation has been corrected and the FCM releases the revised work. Stopping work in these conditions is the responsibility of every worker, SLAC and subcontractor, on-site. (See Work Planning and Control: Stop Work Procedure for details.)
Figure 1  Construction Authorization and Release Process
4 Forms

The following forms are required by this procedure:

- **Work Planning and Control: Job Safety Analysis Form** (SLAC-I-730-0A21J-034). Form for documenting authorization and release of yellow, red, and construction work.
- **Work Planning and Control: Construction Tailgate/Release Form** (SLAC-I-730-0A21J-037). Form for documenting final release of construction work.
- **Work Planning and Control: SLAC Receipt of Subcontractor Form** (SLAC-I-730-0A21J-057). Form for documenting the receipt by SLAC of approved subcontractor forms. (It is not to be used for SLAC forms completed by or for subcontractors; those forms include signature lines for SLAC personnel where needed.)

5 Recordkeeping

The following recordkeeping requirements apply for this procedure:

- Approved forms are to be kept in the work package; work packages are to be kept for 90 days after completion of the work by the FCM.

### Permits / Plans in Effect

- [ ] None
- [ ] Confined Space Entry Permit
- [ ] Construction Project Air Permit
- [ ] Electrical Work Plan (EWP)
- [ ] Elevated Surface Work Plan (ESWP)
- [ ] Energy Isolation Plan (CoHE)
- [ ] Excavation Permit
- [ ] Fire Protection Impairment
- [ ] Hoisting and Rigging Plan
- [ ] Hot Work Permit-Fire (flame or sparks)
- [ ] Penetration Permit
- [ ] Radiological Work Permit
- [ ] Stormwater BMP
- [ ] Traffic Control Plan
- [ ] Other:

### Inspection / Oversight / Certification / License

- [ ] Excavation inspection required and scheduled
- [ ] Scaffold inspection required and scheduled
- [ ] Hot work fire watch required and scheduled
- [ ] Industrial hygiene monitoring/survey required and scheduled
- [ ] Operators’ licenses or certifications verified

### Notes

- Excavation Permit
- Fire Protection Impairment
- Hoisting and Rigging Plan
- Hot Work Permit-Fire (flame or sparks)
- Penetration Permit
- Radiological Work Permit
- Stormwater BMP
- Traffic Control Plan
- Other:

### Additional Checks

- [ ] Plans for changing or extreme weather reviewed
- [ ] Flaggers to control vehicle or pedestrian traffic understand duties
- [ ] Hazardous/non-hazardous waste disposal procedures understood and bins/containers in place
- [ ] Work coordinated within and between adjacent work groups
- [ ] Workers are aware of potential impact and mitigation measures of adjacent work activities
- [ ] Emergency procedures reviewed

Construction subcontractor notifications [10 CFR 851]

- Subcontractor employees must report to their company’s designated representative any hazards not previously identified or evaluated.
- The designated representative must immediately notify the SLAC FCM of any previously unidentified hazards brought to his or her attention.
- Subcontractor ensures workers acknowledge being informed of the hazards and controls associated with assigned work.

Worker Acknowledgment
I understand today’s scope of work and associated hazards and will ensure controls are implemented. I understand I have the authority to stop work, should I have questions or recognize a hazard that may not be adequately controlled.

Authorization (subcontractor foreman): I have reviewed the steps, hazards and controls described above with all workers listed above and authorize them to perform the work. Workers are qualified (that is, licensed or certified, as appropriate, and in full compliance with training requirements) to perform this activity.

Name (print): Signature: Date:

Approval (general subcontractor’s representative): I have conducted a tailgate briefing at which the steps, hazards and controls described above were reviewed and unique area hazards, boundary conditions, and so on communicated.

Name (print): Signature: Date:

Release (FCM): I have communicated unique area hazards, boundary conditions, and so on with the authorizer and/or listed worker(s) and have coordinated this job with affected occupants. Listed workers are released to perform described scope of work.

Boundary conditions, notes (☐ attached):

Name (print): Signature: Date:
This form is used to document the receipt by SLAC of approved subcontractor forms. (It is not to be used for SLAC forms completed by or for subcontractors; those forms include signature lines for SLAC personnel where needed.) It is to be completed by the SLAC field construction manager and a Health and Safety Services representative and attached to the completed form. (See Work Planning and Control: Construction Work Planning and Control Procedure [SLAC-I-720-0A21C-005].)

### SLAC Field Construction Manager

I have received and reviewed the attached, completed subcontractor form.

Chapter 2: Work Planning and Control

Stop Work Procedure

1 Purpose

The purpose of this procedure is to establish a uniform method for stopping work.

Every worker performing any work in or on facilities managed by SLAC has the authority and responsibility to stop work for conditions that threaten imminent danger. SLAC considers no activity to be so urgent or important that its standards for environmental protection, safety, or health may be compromised. Employees have the right and responsibility not to perform tasks or activities they feel pose undue risk to themselves, co-workers, or the environment. Stop work actions take precedence over all other priorities and procedures.

Title 10, Code of Federal Regulations, “Energy”, Chapter 3, “Department of Energy”, Part 851, “Worker Safety and Health Program” (10 CFR 851.20[b][8]) and the SLAC Worker Safety and Health Program Description specifically give every worker the right to decline to perform an assigned task because of a reasonable belief the task poses an imminent risk of death or serious physical harm to the worker. Further, the worker has the right to stop work when they discover any exposure to imminently dangerous conditions or serious hazards. This procedure is used for either of these conditions.

If an imminent danger stop work is necessary, worker(s) must safely stop their work and notify their supervisor(s), who will initiate steps below. In this context, supervisor is the knowledgeable SLAC employee (for example, functional supervisor, administrative supervisor, or point of contact) who authorized the work. For subcontractor construction or high risk work, the subcontractor whose work was stopped must notify their company designated representative who is to promptly notify the SLAC facility construction manager or program manager.

For non-imminent danger stop work, normal supervisory procedures, staff communication, and referral to ESH staff, as appropriate, should be used. For non-imminent danger stop work, line management in the area where the work was stopped and of the workers who were stopped must decide on the appropriate level of communication with other staff. The condition that caused a stop work to be initiated must be evaluated to determine if the controls that are in place will adequately protect people and the environment. If it is unclear as to whether the controls are adequate or if the scope changes, workers must contact their supervisor to discuss the situation and have their work re-authorized as appropriate. It may also be necessary to secure another release.

2 Procedures

For an illustration of this procedure, see Figure 1.
<table>
<thead>
<tr>
<th>Step</th>
<th>Person</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Observation of an Unsafe Situation</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| 1. | Individual initiating stop work | If an imminent danger is observed or a task is assigned that poses risk of death or serious injury, promptly  
▪ Warns any person who is at risk  
▪ Asks the person in a manner that minimizes creating an additional hazard to stop work and discuss the hazardous situation |
| 2. | Individual performing work | If directed to stop work, even if it is only a perceived hazard, worker must safely stop |
| 3. | Individual initiating stop work and Individual performing work | Discuss reason for stop work. If considered an imminent danger, continue to step 4. Otherwise, evaluate the reason for the stop work and determine if work is still within scope or if new hazards have been introduced that are not adequately controlled. If unresolved, unsure or if work plans need to be updated, continue to step 4. |

Reporting stop work to the supervisor or FCM / PM

| 4. | Person performing work | Promptly reports the stop work to supervisor. For construction or high risk subcontractor work, promptly reports to their company designated representative who then notifies the SLAC facility construction manager (FCM) or program manager (PM). |
| 5. | Worker’s supervisor or FCM / PM | If considered an imminent danger, continues to step 6. Otherwise, resolves unsafe situation and re-authorizes work, as necessary. Obtains a re-release if required. Ensures appropriate level of communication to their staff, line management and ESH based on why work was stopped, how long it was stopped, etc. For non-imminent danger stop work, the supervisor must understand and adhere to the re-start expectations of their line management and ESH Division. |

Reporting Imminent Danger stop work to lab management

| 6. | Worker’s supervisor or FCM / PM | Calls ext. 5555 and reports an imminent danger stop work; notifies division / department head |
| 7. | Worker’s supervisor or FCM / PM | If the hazard has already caused an injury or property damage, begins incident investigation process (see Incident Reporting and Investigation Process for more information)  
Addresses extent of condition |
| 8. | Building / area manager | Evaluates equipment status and takes action to ensure equipment is placed in a safe state. Suitable warning labels, barricades, administrative lock and tag, and so on will be used as needed to warn anyone not familiar with the stop work. |
| 9. | Division / department head | Ensures appropriate communication within their division / department and notifies associate laboratory director (ALD) |
| 10. | Worker’s supervisor or FCM / PM | Initiates stop work form (completes sections 1 and 2) for imminent danger and distributes copies to  
▪ Building / area manager  
▪ Division / department head |
### Chapter 2 | Stop Work Procedure

#### Step 11.
**Person:** ALD  
**Action:** Notifies laboratory director and DOE SLAC Site Office

#### Step 12.
**Person:** Worker’s supervisor or FCM / PM  
**Action:** Ensures work does not resume until properly authorized and released

#### Step 13.
**Person:** Division / department head  
**Action:** Follows up on incident investigation (see [Incident Reporting and Investigation Process](#) for more information)

#### Step 14.
**Person:** Worker’s supervisor or FCM / PM  
**Action:** Ensures hazards and controls are updated with investigation results (see [Work Planning and Control: Procedure](#)).  
Ensures that a job safety analysis (JSA) or standard operating procedure (SOP) for the activity is completed and reviewed by directorate ESH coordinator

#### Step 15.
**Person:** Worker’s supervisor or FCM / PM  
**Action:** Sends stop work form with follow-up actions described (Section 3) and supporting documentation to the following for concurrence:  
- Division / department head  
- Directorate ESH coordinator  
- CSO

#### Step 16.
**Person:** Division / department head, directorate ESH coordinator, and CSO  
**Action:** If satisfied with updated controls, concurs with restart of work and signs stop work form (Section 4). If not, contacts worker’s supervisor to revise controls.

#### Step 17.
**Person:** ALD  
**Action:** Authorizes the restart of activities and signs stop work form (Section 5)

#### Step 18.
**Person:** Building / area manager  
**Action:** Grants a release if they are satisfied with the investigation and follow up measures, and signs stop work form (Section 6).  
Ensures lock and tag of any equipment that creates the hazard or imminent danger

#### Step 19.
**Person:** ALD  
**Action:** Confirms a new release has been granted before starting work.  
Informs the laboratory director and the DOE SLAC Site Office

#### Step 20.
**Person:** Worker’s supervisor or FCM / PM  
**Action:** Provides copies of the completed stop work form and supporting documentation to the following:  
- Building or area manager  
- Division/department head  
- Directorate ESH coordinator  
- ALD  
- CSO
### Disputes and Appeals

3 **Forms**

The following forms are required by this procedure:

- **Work Planning and Control: Stop Work Form** (SLAC-I-720-0A21J-002). Form for documenting stop work.

4 **Recordkeeping**

Completed stop work forms must be kept for 90 days by the division / department head identified in Section 4 of the form.

5 **References**

**SLAC Environment, Safety, and Health Manual** (SLAC-I-720-0A29Z-001)

- Chapter 2, “Work Planning and Control”
  - **Work Planning and Control: Procedure** (SLAC-I-720-0A21C-002)

Other SLAC Documents

- **SLAC Worker Safety and Health Program Description** (SLAC-I-720-0A21B-001)
- **Incident Reporting and Investigation Process** (SLAC-I-701-O03-006-00)

Other Documents

When an imminent risk stop work has been issued, the supervisor (that is, the SLAC employee who authorized work) of the person whose work has been stopped must make sure this form is completed and observation recorded in as complete and objective a manner as possible. Upon request by the facility manager, ALD, or CSO, this form will also be used for non-imminent risk stop work.

When completed, copies of this form are to be sent to:
1. Building / area manager
2. Division / department head
3. Directorate ESH coordinator
4. Associate laboratory director (ALD)
5. Chief safety officer (CSO)

Work may not be resumed until this form is signed, indicating re-authorization by the ALD and re-release by the building or area manager.

For additional information, see Work Planning and Control: Stop Work Procedure (SLAC-I-720-0A21C-003).

Chapter 2: Work Planning and Control

Area Hazard Analysis Procedure

1 Purpose

The purpose of this procedure is to ensure that the complex or unique hazards and particular controls (training, PPE/equipment, and access requirements) associated with working in or entering a specific area are adequately identified and communicated. The procedure covers the development and use of area hazard analyses (AHAs). It applies to area managers, ESH coordinators, and associate laboratory directors.

All industrial areas (defined as an area where some level of hazard, for example, moving machinery, noise, electrical, chemical, may exist), accelerator areas, and areas with radiation controls at SLAC must have an AHA. The AHA must be reviewed at least annually and when the training requirements or level or types of hazards change.

In some cases hazards may have been addressed in supporting safety documents (safety assessment documents, citizen committee reviews, fire hazard analyses, independent safety reviews), referencing the supporting document and completing the PPE/equipment and training requirements sections is adequate.

1.1 Program Introduction

Maintaining a safe workplace is the responsibility of everyone at SLAC. Identifying and understanding hazards, the risks they present, and mitigating those hazards is an essential foundation for achieving excellence in environment, health, and safety performance.

When entering an area to observe or conduct work, it is important to consider area hazards. During the planning of any work, one must consider the impact of such hazards. Some may require PPE or training, while others may require a permit.

The AHA program will serve
1. Anyone by providing relevant information about hazards, personal protective equipment (PPE), and access and training requirements for entry
2. Supervisors or those authorizing work by providing information that enhances planning for work conducted by their workforce

1.1.1 Supporting Programs

Work planning and control (WPC) addresses the activity level hazards and controls associated with work conducted anywhere on the SLAC site (see Work Planning and Control: Work Planning and Control Procedure). Furthermore, WPC addresses the authorization and release of activity-level work. The AHA should be referenced during planning, prior to authorization, to ensure that area specific hazards are
considered and that the training and PPE associated with entry are addressed. However, the AHA should not be used to document task-specific controls, such as arc flash protection, lockout/tagout (LOTO), or activity-specific training. Hazards such as compressed gas cylinder storage and ventilation hood velocity measurements are also not addressed by an AHA.

2 Roles and Responsibilities

2.1.1 Area Manager
- Prepares AHA for his or her area
- Reviews AHA at least annually

2.1.2 ESH Coordinator
- Assists line organizations in completing an AHA for all areas requiring one
- Periodically reviews AHAs to ensure that SLAC addresses hazards appropriately and consistently

2.1.3 Associate Laboratory Director
- Is responsible for ensuring this policy is implemented within his or her unit. In all areas for which he or she is accountable, each associate laboratory director is responsible for ensuring that a person is assigned to develop and maintain AHAs.

2.1.4 ESH Division
- Owns and is responsible for administering the AHA program, including providing a lab-wide tool for storing and accessing AHAs

3 Procedure

The AHA must include and clearly communicate the following information:
1. Date
2. Area and building identifier; area and building manager name and contact information
3. Minimum PPE/equipment required to enter the area
4. Training required to enter the area
5. WPC green work release requirements
6. Area-related hazards and associated controls

<td>Area manager</td>
<td>Lists up to 30 area-related hazards and their associated controls</td>
</tr>
<tr>
<td>10.</td>
<td>Area manager</td>
<td>Chooses hazards from the pre-defined list (the associated control will auto populate)</td>
</tr>
<tr>
<td>11.</td>
<td>Area manager</td>
<td>If finished, Select Submit button; if not finished, Select Draft button. Note: when submitted, the AHA is posted in an uneditable format (except by the area manager) in the <a href="#">Area Hazard Analysis Library</a>. If in draft, AHA is listed as pending.</td>
</tr>
</tbody>
</table>
**Step** | **Person** | **Action**
--- | --- | ---
12. | Area manager | Reviews AHA at least annually and when the training requirements or level or types of hazards change

### 4 Forms

The following forms are required by this procedure:
- [Area Hazard Analysis eTool](#) (tool for creating, approving, and storing/viewing AHAs)

### 5 Recordkeeping

The following recordkeeping requirements apply for this procedure:
- Completed AHAs are stored in the [Area Hazard Analysis Library](#).
